

## **The success rates in surrogacy**

Surrogacy is now a well-recognized fertility treatment gaining success the world over where surrogates carries and gives birth to babies. Surrogacy is growing in popularity among couples as a way of having their own children. Even though, surrogacy requires time, money and patience to succeed but if it is carried out through, reputed fertility treatment centers or clinics can bring happiness to all concerned. The choice of surrogacy augurs well for those couples who are unable to carry natural pregnancy due to the following factors-

- Woman who is having or had recurrent miscarriages,
- Health condition that sorts pregnancy and giving birth of a child dangerous for the woman concerned,
- The uterus is irregular or absent since birth or after a hysterectomy,
- Female treatments such as In-Vitro Fertilization (IVF) having failed,
- When the couple are in same sex partnership

All the above-mentioned factors can be easily solved or taken care of through a viable solution known as surrogacy. The custom of surrogate has become quite popular over the years and it is known that there have been differing rates of success for the various types of surrogacy procedures. There are high pregnancy rates with IVF surrogacy and limited case reports have attested to its success. When using IVF procedure with mothers who are under the age of 35 success rate is as high as 60% or more. The other form of surrogacy such as blast cyst transfer that involves fertilized egg being monitored in a laboratory for more than three days or more and then implanting that blast cyst into the uterus of surrogate mother the success rates almost rises by about 10% or more.

Willing surrogates who gets pregnant through fertility treatment and carries the baby to term have high achievement. The achievement for a gestational carrier depends on the quality of eggs available and a healthy uterine of the gestational carrier. The success rate is donor egg program by using specific medication protocol designed to prepare the uterine lining irrespective of age have almost an equal chance of success. The greatest success always comes from an IVF procedure where the sperm donor has thorough medical evaluation; the egg donor is young and has a positive fertile history. In addition, when the

surrogate is also young having met the rigorous fertility criteria then the success rate lies between 55% and 65% for a fresh embryo transfer using two high quality embryos.

The success rates is very high when the entire procedure of IVF and surrogacy procedure (including the subsequent embryo transfers with frozen embryos) are taken into account raking up the success rate to 95% once the surrogate gets pregnant. In manual terms, the live birth rate for gestational surrogacy is somewhere about 20% to 30% per one cycle while the live birth rate for traditional surrogacy is about 5% to 15% per one cycle. The surrogacy success rates at Kiran Infertility Center or KIC is one of the best with 91% success in pregnancy rate and about 85% success in live birth rate over three cumulative cycles using egg donor.
